Nature Advisors
Site Visit Report

Annie Allen
4904 W 72nd St
Prairie Village, KS 66208

May 16, 2026

Nature Advisor(s):
Anna Graether

Annie,

It was such a pleasure to visit your property and talk about your goals for your home's ecosystem support. The following is a detailed report of our conversation, highlights of your property's existing nature-supporting qualities, and recommendations. We hope that the report provides you with more ideas to further your conservation and wildlife adventures.

Thank you for your time,
Anna

I. NATURESCAPING

We discussed opportunities around your landscape for the establishment of native habitat for bird and butterfly food/cover and, of course, your enjoyment as well. Our recommendations for each area of your property are outlined below. As discussed, ***we are not providing you with a particular design but*** rather lists of plants that are suited to the site conditions, will provide benefits to a variety of wildlife, and enhance soil health. Naturescaping is an ongoing process, and we discussed focusing on one or two areas at a time with the long-term vision for a regenerative, ecosystem-sustaining landscape.

If you'd like to learn more hands-on about gardening with natives, consider joining Cydney Ross's Discover Native Gardening sessions, held five times a month at the Anita B. Gorman Conservation Discovery Center, 4750 Troost Ave., KCMO. These in-depth sessions are a great way to learn hands-on by planting, enjoying the camaraderie of other native gardening experts and enthusiasts! Seeing the *right plants in the right place* and watching them grow are keys to having a successful Native Garden. If you can't be there to learn in person, our twice-monthly *Curious by Nature* webinars are the next best thing. Join virtual live sessions to learn about nature, small and large, across Kansas and Missouri. Bring your native landscape questions to ask our experts during the Q&A at the end of the program. Check out our most recent episodes, archived online here.

Please also consider joining us on Facebook at *Deep Roots KC – Friends of Nature Advisors*. It's a supportive space where you can post questions, share pictures of your garden's progress, and connect with others walking a similar path. We'll be there to cheer you on as you grow your own homegrown native habitat.

Plant Recommendations

When suggesting plants for your landscape, we have provided a short list of those we feel best suited for the area's site conditions, your interest, and habitat value. Each area may not be suitable for all the plants on the list, so you can select different combinations that work best for your landscape. Remember to plant with high density and diversity! The more layers, the healthier the natural community and the higher the habitat quality.

Two great starting points for plant selection can be our two short lists of Kansas City's top-performing, high-value native species: Deep Roots' "Sweet 16 Most Likely to Succeed" and Deep Roots KC Keystones.

Area 1 – Back Yard middle section

You asked for feedback on adding prairie plants to your existing turf grass backyard. You indicated you would like to let the turf grass grow un-mowed and add wildflowers and native grasses. A few weeks prior to our visit, you added seeds for Sideoats Grama, Black-Eyed Susan, Coneflower and Little Bluestem and a wildflower mix to the patchy areas in the grass. I checked the germination codes for the plants you mentioned.

- Black-eyed Susans *(Rudbekia hirta)* are a Germination Code C, which means a cold, moist stratification is needed before they will sprout. To naturally stratify seed, surface sow outdoors late fall on a bare (weed-free), compact site and allow seed to overwinter.
- Coneflower (*Echinacea purpurea*), Sideoats Grama (*Bouteloua curtipendula)*, and Little Bluestem (*Schizachyrium scoparium)* are Germination Code A, which means seed should germinate upon sowing in a warm location.

If you are not getting germination this spring, consider trying the following:

- This area gets around 4-6 hours of sun at most. While all these species are full sun to part sun, focusing on the areas that get the absolute most sun may help. We talked about the areas next to the stepping stones as being a prime location. If you'd like to see flowers this summer, consider visiting one of the native plant stores in the area to purchase plants that you could supplement with more seed next year. See the very bottom of this section for a link to native plant nursery information.
- Reduce competition from the turf grass. To increase the chances of successful conversion, seriously consider removing the turf grass in areas where you wish perennials to grow. This could be done by manually cutting out the sod, or by covering it with a layer of wet cardboard topped by compost or mulch, or with clear plastic pinned over the area. The clear plastic solarization method usually takes at least a month in the heat of summer to kill the grass. In any of these scenarios, cutting the turf as low to the ground before starting is helpful.

Area 2 – Back Yard at Tree Border

At the deciduous trees, plant a "Shadier Soft Landings" bed around and under your trees to protect the perimeter of the tree and to provide a "soft landing" for insects that fall from the tree and hibernate. The tree canopy will provide a great support network for hundreds of species of butterflies, moths, sawflies, and other insects – the primary food sources for songbirds. Introducing arrangements of shade-loving native plants beneath the drip line of the tree will not only serve as safe havens for developing larvae of those insects but will also reduce the footprint of turf grass that you must mow regularly during the growing season—a two-for-one beneficial practice. Consider some of these grass and sedge species in the understory:

Grasses:

- Bottlebrush Rye *(Elymus hystrix)* – Provides fabulous texture and interest in wooded areas and is perfect for planting under oaks and other deciduous trees where some light penetrates to the forest floor
- American Beakgrain *(Diarrhena obovata)* – Moderate-height perennial ground cover with dark green glossy, medium-texture foliage that turns white-tipped in winter.

Sedges:

- Oak Sedge *(Carex albicans)* – Small clump-forming perennial sedge with fountain-like form. Does best in part shade to shade in moderate soils. Use as a ground cover, low border, or between other species for mulch and weed control.
- Cedar Sedge *(Carex eburnea)* – Hair-like leaves. Plants spread slowly to form a fine-textured groundcover under trees, shrubs, and other dry shaded locations. Semi-evergreen. Ecological Benefits: Species of butterflies, leaf hoppers, grasshoppers, and beetles feed on sedge foliage.

Spring ephemeral wildflowers are a hallmark of a healthy forest ecosystem – your soft landings bed could feature any, or all the following, as a starting point.

- Celandine Poppy *(Stylophorum diphyllum)* – An early spring bloomer for the shade garden. Showy yellow flowers in April and May are held above lobed, blue-green leaves that bleed yellow.

- Columbine *(Aquilegia canadensis)* – Red and yellow nodding flowers in April and May. Source of nectar for butterflies, bumblebees and hummingbirds. Found naturally on rocky ledges and wooded rocky slopes. Grows and self-seeds easily
- Wild Geranium *(Geranium maculatum)* – A delightful plant for shady borders, shady native plant gardens or open woodland gardens.
- Jacob's Ladder *(Polemonium reptans)* – Very pretty, light blue, bell-shaped flowers in loose clusters appear on sprawling, weak stems in mid to late spring. The foliage looks fresh and green all through the growing season.
- Woodland Spiderwort - (*Tradescantia ernestiana*) is a hardy native perennial that thrives in shady, rocky woodlands and ravines. It produces clusters of vibrant purple, blue, or rose-colored flowers in late spring, each bloom lasting just a day but appearing in succession. Drought-tolerant and low-maintenance, it goes dormant in summer and returns with fresh growth and reblooms in fall.

At the evergreen trees, confine the plantings to the area just a few feet within the dripline rather than completely under the tree, as the shade may be too dense. Consider a groundcover such as:

- Wild Ginger *(Asarum canadense)* – Large, heart-shaped leaves persist well into early winter, forming a tough, attractive groundcover. Hidden beneath the foliage are its unique, bell-shaped flowers.
- Roundleaf Groundsel *(Packera obovata)* – Loose umbels of yellow flowers in April and May on 12-14" stems. The evergreen foliage is rounded and serrated along the edges, growing to a height of 3-4". Plants spread slowly by underground stems. Grows well in dry shade. Host to northern metalmark butterfly.

You asked about growing conditions for morel mushrooms. While I do not have direct experience with this, here are a few websites that have information. It appears to be a several year process of preparing the soil, inoculation, and then growth of the morels. I'd love to hear if you have luck with it!

Basic Design Tips

One of the best ways to decide what arrangements you would like to try is to see examples. The Loose Park Native Garden in Kansas City has one of the most diverse native gardens in the region. Here is the landscape design & native plants in that garden. We recommend visits throughout the year to see the seasonal variations. The Anita B. Gorman Discovery Center also has many examples of bioswales, native plant gardens, plants for pollinators, and other native design ideas. We also recommend taking inspiration from the Deep Roots native landscape webinars or using various online regional sources, such as from Grow Native.

For more visible spaces, you might consider these tips if you'd prefer to create a more traditional/designed look:

- Planting groupings of the same plant species will provide a consistent aesthetic.
- Planting shorter plants in discernible patterns can help create a "tidier" appearance.
- Including grasses and shrubs will add structure and provide a backdrop to flowering plants.
- Placing large stones strategically between the plantings, defining borders, and creating pathways can help to emphasize the look of a "designed" garden.
- Lightly mulching will help to suppress weed growth and give a more finished appearance until ground covers grow to fill in empty spaces

Management of a Habitat Garden

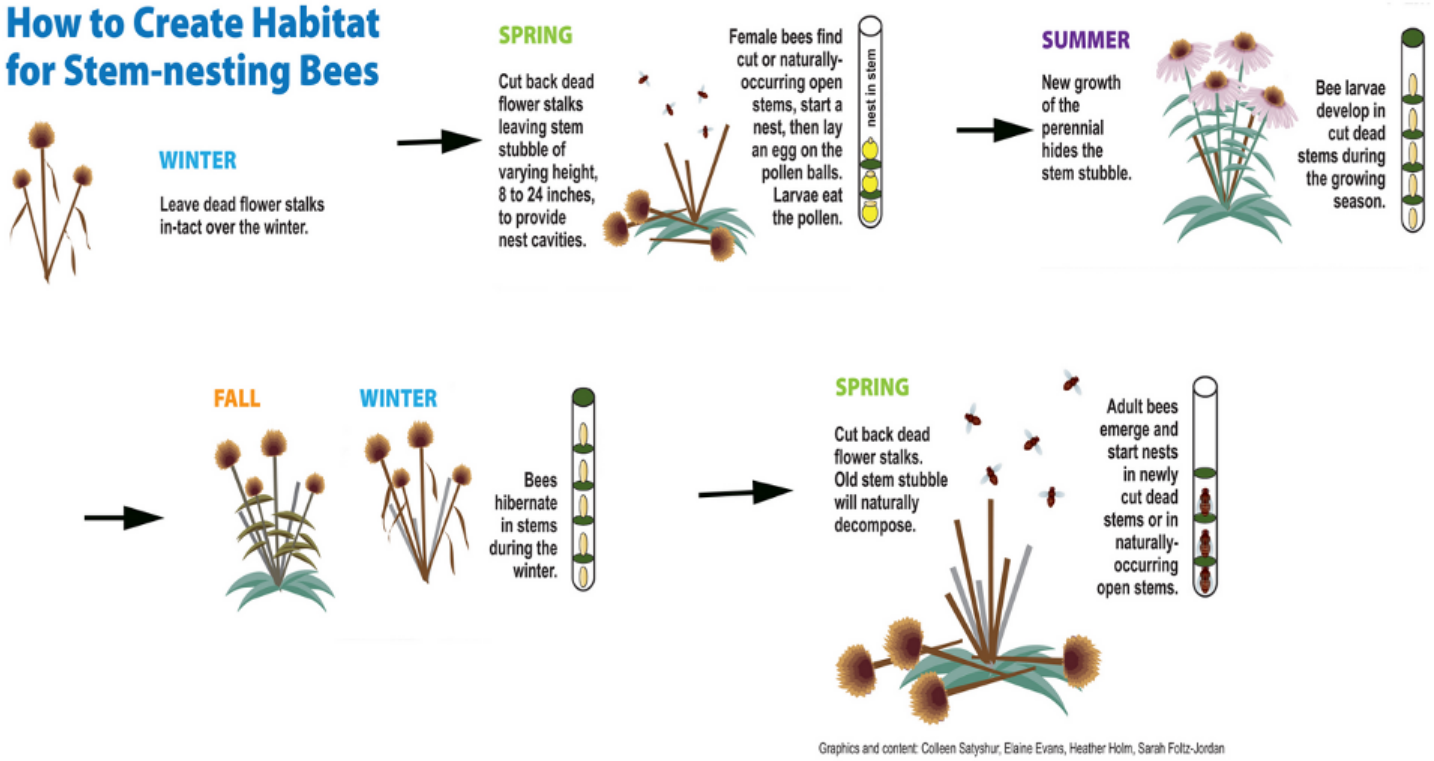

The management of native habitats is different from the maintenance of a traditional landscape. It focuses more on the health of the soil, plants, and respecting the cycle of nature in general. Best practices should be employed to continuously provide habitat for both ground-nesting and stem- or cavity-dwelling native bees.

II. NON-NATIVE, INVASIVE PLANTS & PROBLEMATIC PLANTS

Congratulations on an invasive-free landscape! We have provided links below to detailed resources about three plants causing the most severe environmental degradation in the region. Unfortunately, as you develop native habitat gardens, you will likely find these plants volunteering alongside the functional plants as birds spread their seeds. We encourage you to become familiar with them. While keeping vigil in your own landscape, perhaps you can share the information and recommendations for removal with your friends and neighbors.

Bush Honeysuckle *(Lonicera maackii)*

Japanese Honeysuckle *(Lonicera japonica)*

Wintercreeper *(Euonymus fortunei)*

English Ivy *(Helix hedera)*

Why We Care About Invasive Plants

Native plants struggle to compete with non-native invasives for light, nutrients, and moisture. Most of these plants were brought to the U.S. deliberately for ornamental value, erosion control, or other good intentions. Unfortunately, their spread was not impeded by insects and diseases that control them in their native country. Without intentional control, non-native invasives continue to spread, wreaking havoc on native landscapes.

Invasive plants such as Bush Honeysuckle have allelopathic root systems, which means their roots produce and release chemicals into the soil around them to prevent other plants from growing! Therefore, leaving a Bush Honeysuckle in your yard will make it more difficult for new plants to get established, even after it's removed from the landscape.

Non-native plants may look attractive. However, they do not support the reproduction of butterflies and moths or birds that depend upon their caterpillars for food. Native Missouri songbirds need insect protein most frequently caterpillars to feed their young.

No native plants = fewer native insects/butterflies/moths = further decline in songbirds!!

With landscapes full of non-native and invasive plants that do not provide nourishment, the insects have retreated to the countryside, forcing many of our native songbirds to do the same. We are depleting their food sources when landscaping with non-native plants. We strongly recommend visiting HOMEGROWN NATIONAL PARK[1] by Doug Tallamy for a full description of these interactions.

III. WILDLIFE STEWARDSHIP STRUCTURES

Native Bee Habitat

There are three main things you can do in your landscape to support native bees:

1. Maintain perennial stem nesting bee habitat: How to create habitat for stem-nesting bees.[2]
2. Keep dead wood on sites such as logs, stumps, dead branches on live trees or snags for wood nesting bees.
3. Instead of wood mulch, use leaf mulch or compost which is just as effective but is light enough for ground nesting bees to pass. Increase Nesting Habitat for Native Bees.[3]

Bee Hotels can do more harm than good *if* not constructed or maintained properly. Here is information on what can go wrong and what to look for in a good bee hotel: The horrors of mass-produced bee houses.[4]

For proper maintenance of bee hotels, refer to this guide from Michigan State University: Building and Managing Bee Hotels for Wild Bees.[5]

IV. STORMWATER MANAGEMENT

Cost-Share Reimbursement Programs for Residential Stormwater Solutions

The **Contain The Rain** program in Johnson County, KS encourages individual homeowners and businesses to make improvements to their properties to improve stormwater quality. Contain The Rain is a reimbursement program for most JOCO residents who install pre-approved sustainable landscape solutions that benefit the community's water quality.

Rainwater Harvesting

We recommend rain barrels or cisterns on as many downspouts as possible. They reduce stormwater runoff and erosion. In areas with a mixed stormwater/sewer system they can help prevent treatment facilities from being overwhelmed when heavy rains occur, causing sewage to spill into our waterways.

We see the most success with rain barrel systems that account for:

- Overflow – Even moderate rainfall on a roof can easily generate hundreds of gallons of water, quickly filling almost any size of rain barrel. Make sure it can overflow away from the house's foundation.
- Winter – Water expands when it freezes, and we have seen a number of rain barrels split open because there wasn't an easy way for them to be winterized.
- Mosquitoes – A sealed system or screen at the inlet should keep mosquitoes out.
- Debris – Leaves and dirt that wash off the roof can clog things up. A leaf filter or "first flush" system will help to keep it relatively clean.
- Weight – A 55-gallon barrel weighs over ***450 pounds*** when full. Make sure there is a sturdy base for it to rest on, compacted gravel or a small stone pad should be adequate.
- Algae – Where possible, situate a rain barrel or cistern in a shaded spot to avoid algal growth. If a sunny location is the only option, a dark, opaque material is recommended.

If you don't want to store the water for your garden, equip a low-pressure soaker hose made specifically for rain barrels; it will slowly soak into the ground and it's almost hands-free. Good Ideas for a Rain Barrel Soaker Hose[6]

For more information:

- Rainscaping Guide: Rainwater Harvesting[7]
- Local Rainwater Harvesting Resources[8]

Why we care about stormwater management

Heavy rains can wash insecticides or fertilizers used on lawns into nearby waterways where they do severe damage to aquatic wildlife. Even pet waste contains phosphates and nitrates that contribute significantly to harmful algal growth[9].

Vegetated surfaces help slow down rainwater runoff, encouraging water infiltration and the deposition of dirt and debris carried by rainwater, keeping pollutants out of the stormwater system or local waterways. Adding more native plants ***and a possible rain garden/bioswale*** will help to further reduce water runoff from your landscape and improve water quality in your community.

V. EDUCATION AND VOLUNTEERISM

Community Science

Consider these community science programs, especially those focused on native wildlife.

Feeder Watch[10] is a longstanding initiative of the Cornell Lab of Ornithology which runs from November - April. Participants choose a location to observe birds - your own bird feeder or another natural area - then enter your bird counts online, enabling you to contribute to a continental data set of bird distribution and abundance.

Monarch Watch:[11] Monarch Watch is a nonprofit education, conservation, and research program based at the University of Kansas that focuses on the monarch butterfly, its habitat, and its spectacular fall migration. There are many opportunities to engage with this organization.

iNaturalist[12] is an app which can be useful in helping you to identify various flora and fauna. A joint initiative of the California Academy of Sciences and the National Geographic Society, this tool also allows you to share your observations with trained scientists who can make valuable use of data collected by community scientists like you.

National Geographic[13] has assembled a large list of easily accessible projects.

Missouri Master Naturalist Programs (find a chapter[14])

Kansas Master Naturalist Programs (Johnson County, KS[15])

Stream Team:[16] Missouri has 110,000 miles of streams that provide recreation, drinking water and serenity for us and our children, but they need your help. Stream Team has a busy calendar of litter pickups, tree plantings, streambank stabilization, volunteer water quality monitoring and other activities.

[16] "Missouri Stream Team." http://mostreamteam.org/. Accessed 8 Feb. 2022.

Learning Opportunities

Loads of native plant educational programs exist in webinar format, but many in-person opportunities also abound. Programs include these offerings:

Plan It Native[17] is developed by Deep Roots and other partnering organizations. It presents an educational conference with nationally renowned speakers for professionals to beginners. Plan It Native 2026 will be held live and in-person at the Kaufmann Foundation Conference Center & Anita Gorman Discovery Center on February 10th and 11th, 2026!! Registration will be open in Fall 2025.

Deep Roots[18] offers free short webinars every month on the first and third Thursdays at noon. Our *Curious By Nature* sessions explore native landscapes in the KC area and throughout Missouri. The *Lunch & Learn* series covers topics ranging from restoring prairies to planting natives in the smallest urban garden, bringing professional insight to you right at your computer. Volunteer opportunities also exist at deeproots.org/get-involved

Missouri Department of Conservation's nature centers at nearby places like Anita B. Gorman Discovery Center and Burr Oak Woods Conservation Area in Kansas City. **Events | Missouri Department of Conservation**.[19]

Missouri Botanical Garden (especially the **Native Plant School series from the Shaw Nature Reserve**[20])

Missouri Master Naturalist Programs (find a chapter[21])

Kansas Master Naturalist Programs (Johnson County, KS[22])

Grow Native![23] hosts regular webinars about native plants.

Spread the Word

Please share your experience, the program and our resources with your friends, neighbors, and relatives. Every landscape that incorporates native plants becomes a wildlife habitat that is critical for the future of our birds, native wildlife, and our quality of life.

VII. DISCLAIMER

Deep Roots KC, its employees or volunteers make no direct or implied guarantee about any of the recommendations in this report or discussions during the related landscape survey. Our advice is focused on selecting the right native plants for the right place to provide the desired habitat value. Yet the success of any habitat gardening approach is determined by many other factors as well, including, in part, the quality and origin of the materials, the installation process, and the maintenance routine. Landowners especially concerned about their ability to achieve the desired results are encouraged to consult the references included in this report ***including the services of a native landscape professional.***
