Nature Advisor(s):
Sunny Branick
Jesse Ostrander
Shelley Shipley

Sandra,

It was such a pleasure to visit your property and talk about your goals for your home's ecosystem support. The following is a detailed report of our conversation, highlights of your property's existing nature-supporting qualities, and recommendations. We hope that the report provides you with more ideas to further your conservation and wildlife adventures.

Thank you for your time,
Sunny Branick
Jesse Ostrander
Shelley Shipley

Table of Contents

I. NATURESCAPING 3
Area 1 – Southern Berm 3
Area 2 – Northern Face and Back Yard 5
Additional Notes 6

VI. RESOURCES 16
VII. DISCLAIMER 16

I. NATURESCAPING

We discussed opportunities around your landscape for the establishment of native habitat for bird and butterfly food/cover and, of course, your enjoyment as well. Our recommendations for each area of your property are outlined below. As discussed, ***we are not providing you with a particular design but*** rather lists of plants that are suited to the site conditions, will provide benefits to a variety of wildlife, and enhance soil health. Naturescaping is an ongoing process, and we discussed focusing on one or two areas at a time with the long-term vision for a regenerative, ecosystem-sustaining landscape.

If you'd like to learn more hands-on about gardening with natives, consider joining Cydney Ross's Discover Native Gardening sessions, held five times a month at the Anita B. Gorman Conservation Discovery Center, 4750 Troost Ave., KCMO. These in-depth sessions are a great way to learn hands-on by planting, enjoying the camaraderie of other native gardening experts and enthusiasts! Seeing the *right plants in the right place* and watching them grow are keys to having a successful Native Garden. If you can't be there to learn in person, our twice-monthly *Curious by Nature* webinars are the next best thing. Join virtual live sessions to learn about nature, small and large, across Kansas and Missouri. Bring your native landscape questions to ask our experts during the Q&A at the end of the program. Check out our most recent episodes, archived online here.

Please also consider joining us on Facebook at *Deep Roots KC – Friends of Nature Advisors*. It's a supportive space where you can post questions, share pictures of your garden's progress, and connect with others walking a similar path. We'll be there to cheer you on as you grow your own homegrown native habitat.

Plant Recommendations

When suggesting plants for your landscape, we have provided a short list of those we feel best suited for the area's site conditions, your interest, and habitat value. Each area may not be suitable for all the plants on the list, so you can select different combinations that work best for your landscape. Remember to plant with high density and diversity! The more layers, the healthier the natural community and the higher the habitat quality.

Two great starting points for plant selection can be our two short lists of Kansas City's top-performing, high-value native species: Deep Roots' "Sweet 16 Most Likely to Succeed" and Deep Roots KC Keystones.

Area 1 – Southern Berm

The goals and constraints for this area as follows:

- No plants with white or yellow flowers.
- Desired a palette of blues, purples, and reds.
- Multi-season interest
- Keep the Leatherleaf Viburnums and Lilacs
- Manage the erosion

As you have many tall woody specimens, we are going to focus on species that are approximately 4ft tall or less.

- American Beautyberry (*Callicarpa americana*) – Small, long-lived native shrub known for its striking clusters of bright purple berries that appear in fall. It produces small pink flowers from June through August that attract pollinators and grows about 3–5 feet tall and wider, thriving in full sun to part shade. The plant may die back after harsh winters, so they benefit from a layer of mulch in fall.
- Aromatic Aster *(Symphyotrichum oblongifolium)* – One of the last wildflowers to bloom, this aster is loaded with blue-purple daisy-like flowers in late fall. By chopping the stems in late spring this aster grows into a tidy, compact, self-supporting mound and may even be grown as a short hedge or border.
- Blue Wild Indigo (*Baptisia australis*)—Long-lived perennial with smooth grayish-white stems, rounded leaflets, and tall spikes of blue, lupine-like flowers that emerge in spring. It typically grows about 3–4 feet tall and wide, forming a shrub-like clump over time and thriving in full sun to part shade.
- Bush's Poppy Mallow *(Callirhoe bushii)* – combining Bush's Poppy Mallow with Rose Verbena will add big impact to this area. This plant has a mounding, arching form (1-2 ft tall), while the Rose Verbena spreads low (6-12 in tall) and bloom for a long season.
- Fire Pink *(Silene virginica)* – a striking native wildflower with vivid red blooms that attract hummingbirds in early spring. It thrives in full sun to light shade and does best in well-drained, rocky soils (even growing in rock crevices) and will often self-sow.
- Glade Coneflower (*Echinacea simulata*) – a graceful native with drooping lavender-pink petals that bloom in June. Loved by wildlife, it attracts butterflies and bees, while goldfinches feed on the seeds in its distinctive brown cones. It thrives in sunny, dry soils.
- Purple Poppy Mallow *(Callirhoe involucrata)* – Low, mat-forming perennial that produces showy red-violet, cup-shaped flowers from early summer through frost, with trailing stems that spill over edges and spread about 2–3 feet wide. Growing only about 6–9 inches tall, it makes an excellent ground cover for sunny beds, dry or rocky soils, and even more formal plantings where a shorter plant is desired.
- Rose verbena *(Glandularia canadensis)* – A trailing plant that spreads quickly to form an attractive ground cover. Flat-topped clusters of rose-pink to rose-purple flowers appear on top of stems for several months from spring intermittently to frost (March-November). Use as groundcover; spreads readily.
- Sand Phlox *(Phlox bifida)* – Beautiful pale purple, star-like flowers in spring adorn this low-spreading native that grows in dry areas with shade or sun. Each flower petal has a V-shaped notch on its edge, giving a fringed appearance. Short, pale green, thread-like leaves form thick mats.
- Thread-Leafed Blue Star (*Amsonia ciliata)* – Ornamental, clump-forming native perennial that produces clusters of pale blue, star-shaped flowers that attract butterflies and hummingbirds while typically being ignored by deer. It grows about 15–24 inches tall, with soft, pine-needle-like foliage that turns a pleasant yellow at the end of the season. Cut back to 8–10 inches after flowering for a rounded shape.

We also spoke of your barberry bush that was in decline. We suggested you consider a small understory tree, such as a Flowering Dogwood (*Cornus florida*). Flowering Dogwoods typically have white flowers, but there is a naturally occurring red variety (*Cornus florida var rubra*). This is a small, low-branched tree with spreading horizontal branches. Distinctive white or red flowers, 3″ in diameter, bloom mid-April to mid-May. Clusters of

glossy red fruit in fall persist into winter and are relished by birds. Consistent deep red fall leaf color. Host to larvae of the spring azure butterfly (*Celastrina ladon*).

Area 2 – Northern Face and Back Yard

These areas are almost entirely in the shade or have dappled light and are wetter than the front berm. Continuing to stay away from anything with yellow or white flowers, we would recommend you try the following.

- Blue-eyed Grass *(Sisyrinchium angustifolium)* – Noted for its violet-blue flowers and branched flowering stems. Not a grass, per se, but a thin-leaved member of the Iris family. It is native to Missouri where it occurs in damp open woods, slopes and along stream banks throughout much of the State.
- Columbine *(Aquilegia canadensis)* – Nodding red and yellow blooms in April and May that attract hummingbirds, butterflies, and bumblebees. It grows easily in well-drained soil in sun to part shade, often self-seeding to form colonies on rocky slopes and woodland edges. After blooming, plants can be cut back to the ground to encourage fresh foliage. You already have a great deal of this, so moving it around the property could give you a more cohesive feeling.
- Dittany (*Cunila origanoides*) – A small mint plant that is habitually orderly and clean in appearance. By September and October it reaches just 12 to 16 inches tall and wide, and is covered in small, heart-shaped leaves and tiny pinkish lavender flowers. May be used as a culinary herb.
- Eastern Bee Balm *(Monarda bradburiana)* – A clump-forming, mint family member that grows typically to 1-2' tall. Each flower head rests on a whorl of showy, purplish, leafy bracts. Flowers attract bees and butterflies when they bloom in May and June. The aromatic gray-green leaves may be used in teas.
- Jacob's Ladder *(Polemonium reptans)* – Very pretty, light blue, bell-shaped flowers in loose clusters appear on sprawling, weak stems in mid to late spring. The foliage looks fresh and green all through the growing season.
- Virginia Bluebells (Mertensia virginica)—Spring ephemeral blooming clusters of blue bells in mid-April. Plants die back in summer. Part shade to full shade, medium moisture.
- Wild Geranium *(Geranium maculatum)* – Woodland perennial that forms a mound of deeply cut green foliage and blooms with pink to lilac, five-petaled flowers for 6–7 weeks in spring. It's a great choice for shady borders or woodland gardens. Its distinctive beaked seed capsules—giving rise to the name "crane's bill"—provide seeds that birds enjoy.
- Woodland Phlox/Wild Sweet William *(Phlox divaricata)* – Loose clusters of white to blue to blue-violet, star-shaped flowers early in spring provide nectar for hummingbirds and butterflies. The flowers are sweetly scented. Evergreen basal leaves.
- Woodland Pink *(Spigelia marilandica)* – Woodland Pink is quietly spectacular, growing in naturally open wood edges and along streams. This perennial is easy to grow and attracts hummingbirds. Blooms from spring to summer with dazzling displays of upright bright, crimson and yellow tubular flowers. We know you wanted to stay away from yellow, but the colors are very similar to the Columbine you

already have established. As the plants bloom in different seasons, the repetition of color will help reinforce the aesthetic cohesion you are seeking.

Additional Notes

You asked if we had a specific brand of garden soil or topsoil we would recommend. They are more or less the same; you'll probably get similar results from any product.

If you are looking to amend your soil, incorporating a small amount of compost can be beneficial for improving soil structure and adding organic matter, especially in areas with heavy clay or sandy fill.

That said, one of the great advantages of using native plants is that they are well adapted to our Missouri soils and typically don't require additional inputs to establish and thrive.

Basic Design Tips

One of the best ways to decide what arrangements you would like to try is to see examples. The Loose Park Native Garden in Kansas City has one of the most diverse native gardens in the region. Here is the landscape design & native plants in that garden. We recommend visits throughout the year to see the seasonal variations. The Anita B. Gorman Discovery Center also has many examples of bioswales, native plant gardens, plants for pollinators, and other native design ideas. We also recommend taking inspiration from the Deep Roots native landscape webinars or using various online regional sources, such as from Grow Native.

For more visible spaces, you might consider these tips if you'd prefer to create a more traditional/designed look:

- Planting groupings of the same plant species will provide a consistent aesthetic.
- Planting shorter plants in discernible patterns can help create a "tidier" appearance.
- Including grasses and shrubs will add structure and provide a backdrop to flowering plants.
- Placing large stones strategically between the plantings, defining borders, and creating pathways can help to emphasize the look of a "designed" garden.
- Lightly mulching will help to suppress weed growth and give a more finished appearance until ground covers grow to fill in empty spaces
- Since you are in an HOA, we suggest taking a look at the Native Landscape Plans through Grow Native. Especially the Front Yard Formal Shade and Front Yard Formal Sun.

Management of a Habitat Garden

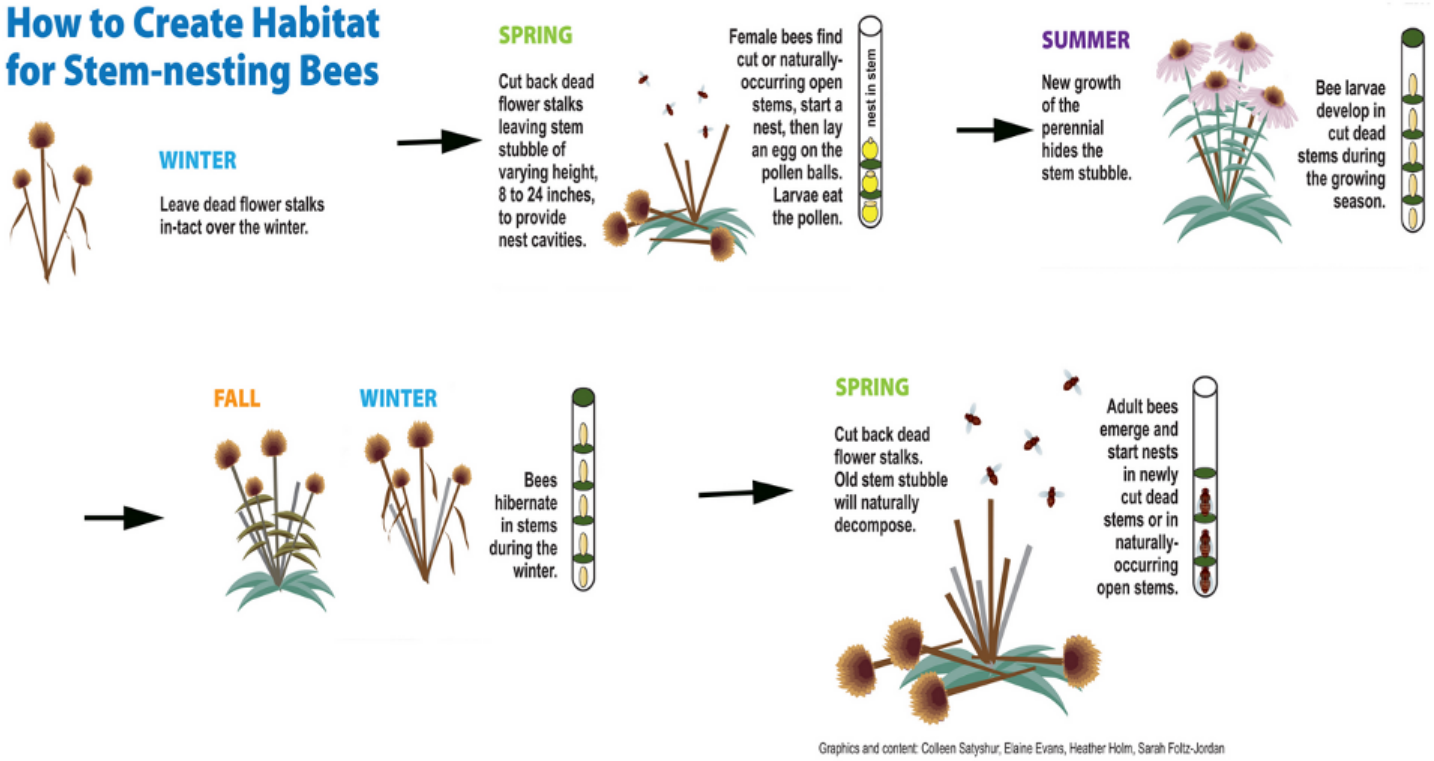

The management of native habitats is different from the maintenance of a traditional landscape. It focuses more on the health of the soil, plants, and respecting the cycle of nature in general. Best practices should be employed to continuously provide habitat for both ground-nesting and stem- or cavity-dwelling native bees.

II. NON-NATIVE, INVASIVE PLANTS & PROBLEMATIC PLANTS

We found the following invasive plants in your landscape during our visit:

English Ivy *(Helix hedera)*

Across the street, there is an infestation of the following invasive plants. While they are not your responsibility to remove, we do recommend you keep an eye out for them seeding themselves into your property.

Bush Honeysuckle *(Lonicera maackii)*

Wintercreeper *(Euonymus fortunei)*

For additional details on the ecology and steps to clear away these plants, see the linked references. Please follow the detailed instructions in the reference and follow all safety precautions.

Why We Care About Invasive Plants

Native plants struggle to compete with non-native invasives for light, nutrients, and moisture. Most of these plants were brought to the U.S. deliberately for ornamental value, erosion control, or other good intentions. Unfortunately, their spread was not impeded by insects and diseases that control them in their native country. Without intentional control, non-native invasives continue to spread, wreaking havoc on native landscapes.

Invasive plants such as Bush Honeysuckle have allelopathic root systems, which means their roots produce and release chemicals into the soil around them to prevent other plants from growing! Therefore, leaving a Bush Honeysuckle in your yard will make it more difficult for new plants to get established, even after it's removed from the landscape.

Non-native plants may look attractive. However, they do not support the reproduction of butterflies and moths or birds that depend upon their caterpillars for food. Native Missouri songbirds need insect protein most frequently caterpillars to feed their young.

No native plants = fewer native insects/butterflies/moths = further decline in songbirds!!

With landscapes full of non-native and invasive plants that do not provide nourishment, the insects have retreated to the countryside, forcing many of our native songbirds to do the same. We are depleting their food sources when landscaping with non-native plants. We strongly recommend visiting HOMEGROWN NATIONAL PARK[1] by Doug Tallamy for a full description of these interactions.

Grow Native Professional Resource Guide

Hummingbirds vs. Wasps

You mentioned that you enjoyed the hummingbird feeder you once had but removed it when the wasps started bullying the hummingbirds. What's likely happening is that it was one of their sole sources of food. When resources are limited or centralized, they get more aggressive and territorial. Instead of removing everything, we can spread resources out so there's less competition and less crowding in one spot.

For example, we can place multiple feeders in different areas, use designs that are less accessible to wasps, and even give them an alternate food source away from where you spend time. Pairing that with a wider variety of plants helps distribute activity across the yard, so you're not seeing everything happen right in front of you.

The end result is a yard that feels much calmer while still supporting wildlife, but in a way that's more comfortable for you to actually enjoy.

Here is a great article from *Birds & Blooms* to give you some ideas on how to manage the situation, if you choose to hang hummingbird feeders again, 7 Natural Ways to Keep Bees and Wasps Away From Hummingbird Feeders

IV. STORMWATER MANAGEMENT

Why we care about stormwater management

Heavy rains can wash insecticides or fertilizers used on lawns into nearby waterways where they do severe damage to aquatic wildlife. Even pet waste contains phosphates and nitrates that contribute significantly to harmful algal growth[2].

Vegetated surfaces help slow down rainwater runoff, encouraging water infiltration and the deposition of dirt and debris carried by rainwater, keeping pollutants out of the stormwater system or local waterways. Adding more native plants ***and a possible rain garden/bioswale*** will help to further reduce water runoff from your landscape and improve water quality in your community.

V. EDUCATION AND VOLUNTEERISM

Community Science

Consider these community science programs, especially those focused on native wildlife.

Feeder Watch[3] is a longstanding initiative of the Cornell Lab of Ornithology which runs from November - April. Participants choose a location to observe birds - your own bird feeder or another natural area - then enter your bird counts online, enabling you to contribute to a continental data set of bird distribution and abundance.

Monarch Watch[4] is a nonprofit education, conservation, and research program based at the University of Kansas that focuses on the monarch butterfly, its habitat, and its spectacular fall migration. There are many opportunities to engage with this organization.

iNaturalist[5] is an app which can be useful in helping you identify various flora and fauna. A joint initiative of the California Academy of Sciences and the National Geographic Society, this tool also allows you to share your observations with trained scientists who can make valuable use of data collected by community scientists like you.

National Geographic[6] has assembled a large list of easily accessible projects.

Missouri Master Naturalist Programs (find a chapter[7])

Kansas Master Naturalist Programs (Johnson County, KS[8])

Stream Team[9] Missouri has 110,000 miles of streams that provide recreation, drinking water and serenity for us and our children, but they need your help. Stream Team has a busy calendar of litter pickups, tree plantings, streambank stabilization, volunteer water quality monitoring and other activities.

Learning Opportunities

Loads of native plant educational programs exist in webinar format, but many in-person opportunities also abound. Programs include these offerings:

Plan It Native[10] is developed by Deep Roots and other partnering organizations. It presents an educational conference with nationally renowned speakers for professionals to beginners. Plan It Native 2026 will be held live and in-person at the Kaufmann Foundation Conference Center & Anita Gorman Discovery Center on February 10th and 11th, 2026!! Registration will be open in Fall 2025.

Deep Roots[11] offers free short webinars every month on the first and third Thursdays at noon. Our *Curious By Nature* sessions explore native landscapes in the KC area and throughout Missouri. The *Lunch & Learn* series covers topics ranging from restoring prairies to planting natives in the smallest urban garden, bringing professional insight to you right at your computer. Volunteer opportunities also exist at deeproots.org/get-involved

Missouri Department of Conservation's nature centers at nearby places like Anita B. Gorman Discovery Center and Burr Oak Woods Conservation Area in Kansas City. **Events | Missouri Department of Conservation**.[12]

Missouri Botanical Garden (especially the **Native Plant School series from the Shaw Nature Reserve**[13])

Missouri Master Naturalist Programs (find a chapter[14])

Kansas Master Naturalist Programs (Johnson County, KS[15])

Grow Native![16] hosts regular webinars about native plants.

Spread the Word

Please share your experience, the program and our resources with your friends, neighbors, and relatives. Every landscape that incorporates native plants becomes a wildlife habitat that is critical for the future of our birds, native wildlife, and our quality of life.

VII. DISCLAIMER

Deep Roots KC, its employees or volunteers make no direct or implied guarantee about any of the recommendations in this report or discussions during the related landscape survey. Our advice is focused on selecting the right native plants for the right place to provide the desired habitat value. Yet the success of any habitat gardening approach is determined by many other factors as well, including, in part, the quality and origin of the materials, the installation process, and the maintenance routine. Landowners especially concerned about their ability to achieve the desired results are encouraged to consult the references included in this report ***including the services of a native landscape professional.***
